Service Description

Abstract

This is the template for Service Description (SD document) according to the Eclipse Arrowhead documentation structure.

1 Overview

This document describes the **service-register** service, which is enables autonomous service registration. Examples of this interaction is a system that has the capability to provide some kind of service. To enable other systems to use, to consume it, this service needs to be offered through the ServiceRegistry.

The rest of this document is organized as follows. In Section 2, we describe the abstract message functions provided by the service. In Section 3, we end the document by presenting the data types used by the mentioned functions.

Version 4.4.0 Status RELEASE Page 4 (9)

1.1 Significant Prior Art

Describe significant prior art which provides the foundation for the service - May be omitted for simple services

1.2 How This Service Is Meant to Be Used

Describe intended usage of the service

Version 4.4.0 Status RELEASE Page 5 (9)

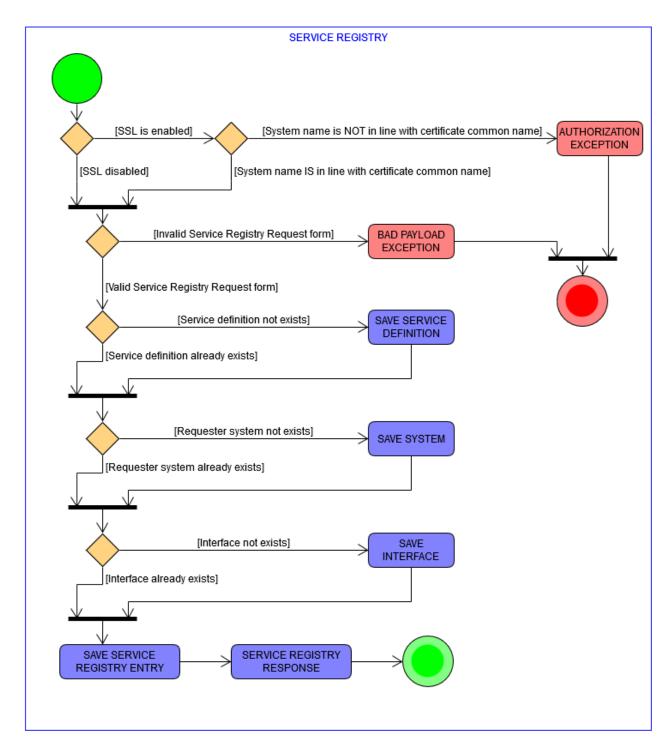

Figure 1: EXAMPLE: Information model as a UML activity diagram. Describes the process of service registration.

1.3 Important Delimitations

No delimitations.

Version 4.4.0 Status RELEASE Page 6 (9)

2 Service Interface

This section describes the interfaces to the service. The **service-register** service is used to register services. A service could contain various metadata as well as a physical endpoint. The various parameters are representing the necessary service input information. In particular, each subsection names an interface, an input type and an output type, in that order. The input type is named inside parentheses, while the output type is preceded by a colon. Input and output types are only denoted when accepted or returned, respectively, by the interface in question. All abstract data types named in this section are defined in Section 3.

The following interfaces are available.

2.1 interface HTTP/TLS/JSON (ServiceRegistryRequest): ServiceRegistryResponse

short overview

Version 4.4.0 Status RELEASE Page 7 (9)

3 Information Model

Here, all data objects that can be part of the **ServiceRegister** service provides to the hosting System are listed in alphabetic order. Note that each subsection, which describes one type of object, begins with the *struct* keyword, which is used to denote a collection of named fields, each with its own data type. As a complement to the explicitly defined types in this section, there is also a list of implicit primitive types in Section 3.3, which are used to represent things like hashes and identifiers.

3.1 struct ServiceRegistryRequest

Field	Туре	Description
endofValidity	DateTime	Service is available until this UTC timestamp.
interfaces	Array <interface></interface>	List of interfaces the service supports.
metadata	Metadata	Metadata
providerSystem	Object	Descriptor of the provider system.
secure	SecureType	Type of security the service uses.
serviceDefinition	Name	Identifier of the service.
serviceUri	URI	URI of the service.
version	Version	Version of the service.

3.2 struct ServiceRegistryResponse

Field	Туре	Description
createdAt	DateTime	Service instance record was created at this UTC timestamp.
endofValidity	DateTime	Service is available until this UTC timestamp.
id	Number	Identifier of the service instance
interfaces	Array <interface></interface>	List of interfaces the service supports.
metadata	Metadata	Metadata
providerSystem	Object	Descriptor of the provider system record.
secure	SecureType	Type of security the service uses.
serviceDefinition	Object	Descriptor of the serviceDefinition record.
serviceUri	URI	URI of the service.
updatedAt	DateTime	Service instance record was modified at this UTC timestamp.
version	Version	Version of the service.

3.3 Primitives

Types and structures mentioned throughout this document that are assumed to be available to implementations of this service. The concrete interpretations of each of these types and structures must be provided by any IDD document claiming to implement this service.

Version 4.4.0 Status RELEASE Page 8 (9)

Туре	Description
Address	A string representation of the address
Boolean	One out of true or false.
DateTime	Pinpoints a specific moment in time.
Object	Set of primitives and possible further objects.
Interface	Any suitable type chosen by the implementor of the service.
List <a>	An array of a known number of items, each having type A.
Name	A string identifier that is intended to be both human and machine-readable.
Number	Decimal number
Version	Specifies a service version.
